STHS: Caring for the Northshore since 1954

Most of the time, wounds heal all by themselves. But sometimes, they need a little help. That's where St. Tammany Health System's highly trained Hyperbaric Oxygen Therapy team comes in.

Hyperbaric Oxygen Therapy is a widely used, pain-free medical treatment in which, through the use of a specially designed, pressurized chamber, a patient breathes 100% oxygen for a prescribed length of time. The result is an oxygen-enriched bloodstream that promotes healing.

Uses for hyperbaric oxygen therapy include:

- » Diabetic wound in the lower extremity.
- » Osteoradionecrosis.
- » Soft-tissue radionecrosis.
- » Chronic refractory osteomyelitis.

The STHS Wound Care Clinic is conveniently located at the Paul D. Cordes Outpatient Pavilion at 16300 Highway 1085 (Bootlegger Road) in Covington.
